Recruitment task

Using the website https://www.fakenamegenerator.com/, generate 6 random identities. Retrieve the following information: first name, last name, gender, and email address. Then, in the MyCRM* application, fill in the data for each person, save it, and check if it has been saved. Finally, save all the data to an output file (.csv or Excel). The generated identities should have the following parameters (advanced tab on the generator's website):

1. Gender - male 60%

2. Country - Sweden

3. Name set - American.

When building the automation, remember to:

1. Divide activities into multiple workflows to maintain order and have the possibility of easily expanding the robot in the future.

2. Make certain parameters, such as the number of identities, easily modifiable (configuration file).

3. Ensure that the robot can handle errors in the application (e.g., close the browser window during processing).

4. Use Modern Design Experience.

5. Separate the stage of collecting input data from its processing.

MyCRM

MyCRM is a training application provided by UiPath for practicing automation of desktop applications. The easiest way to access it is through the UiPath forum. Link to the forum with the link: https://forum.uipath.com/t/sample-apps-to-use-alongside-the-videos/16648

Please remember that MyCRM is a training application, so some of its functions are not operational.

Submitting the Task: When sending the task, pack it into a .zip format without the MyCRM.exe program, and do not password-protect the archive, as a firewall might reject such an email.
